

ABSTRACT OF THE DISCLOSURE

This invention is a infant and child polyurethane foam 24" square support cushion with a 12" square center cut-out well region in which the child sits who needs help sitting up unsupported at rest or play or to learn how to support self on knees while learning how to crawl. This invention offers the new concept of offering a firmer, more durable cushion that supports children with four surrounding 5" high sides that do not allow the child to fall over and that teach the child how to support self in a seated position or a crawling position.
